

# DishSkinz Installation Guide

Unpack your *DishSkinz* from the shipping package. Handle your *DishSkinz* with caution—any damage may interfere with your satellite signal. While installation is easily done before your satellite dish has been set up, *DishSkinz* can also be installed on a satellite dish that is already mounted.

Clips are also provided for installation. If the cover is a perfect fit to your dish, you may decide to install the cover using both adhesive tape and clips.

## INSTALLATION OF THE DISHSKINZ™ SATELLITE COVER

### Step 1

Make sure your satellite dish is clean and free of oils or dirt that can affect proper adhesion. We suggest wiping the surface with alcohol. For best results, the temperature should be over 50°.

### Step 2

Remove the backing on each piece of adhesive tape. Make sure you are lined up properly before applying pressure, as the *DishSkinz* will not be easily removed to realign. You can also damage the adhesive tape that you need for proper mounting.

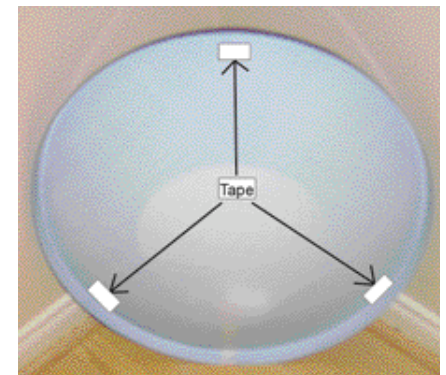

### Step 3

Carefully apply moderate pressure over the face of the dish to ensure the tape achieves maximum hold between the *DishSkinz* and the dish surface.

Installation is now complete!

## NOTES:

- Use extreme caution when securing your satellite skin to a dish already mounted on a rooftop or high wall location. We recommend you have help in these types of installation situations.
- Installation of your *DishSkinz* will not interfere with your satellite signal.
